

Enterprise Laptop Backup

Online data protection for Mobile Users

Storadata is a leading vendor of online backup solutions for the protection against data loss on laptops. Storadata software provides automated, efficient and secure online backup, reducing the risk of data loss to almost zero. While the user is at work, all important data is automatically backed up, every day.

LAPTOP PROTECTION CHALLENGE

The percent of laptops purchased by corporations as a percent of the total systems purchased grows from 29% in 2005 to 44% in 2010. Protecting these laptops is a special data protection challenge that requires a backup solution designed for that environment. Most companies do not back up laptop data. Instead, they rely on users to move important data to shared drives or manage a backup process on their own. Storadata is the product that meets the unique requirements of protecting these laptops against data loss caused by loss, damage or other incidents.

HIGHLIGHTED FEATURES

- **PLATFORMS** - Storadata supports Windows XP, Vista and Mac OS-X.
- **EMAIL BACKUP** - Storadata automatically detects programs like Outlook, Outlook Express and Windows Live Mail, to ensure a secure protection of all email communication.
- **LOW BANDWIDTH** - Storadata scans all files for changes and uploads only a patch containing the differences. Combined with 64 bits data compression this limits upload times dramatically, making the solution also useful for low internet speed connections.

Roger King, CEO of Internet Solutions Pty Ltd:
"Organizations are increasingly seeking reliable workforce solutions that ensure the highest level of productivity without compromising security. We've tested and evaluated all best-of-breed products for our needs and Storadata stood out, because of their genuine understanding of our customers' challenges."

- **BACKGROUND PROCESS** - Storadata uses Volume Shadow Copy and makes backups in the background, without interfering with the employee's daily work. Even files that are in use (e.g. email files) are backed up.
- **CENTRAL ROLL-OUT** - IT-administrators can centrally install, configure and roll-out Storadata to thousands of laptop users at once. This limits the effort of the user to a minimum.
- **CENTRAL MONITORING** - Through a central, user-friendly web-interface, IT-administrators can manage all backup accounts remotely.
- **SECURITY** - Storadata encrypts all data with a private key using AES 128/256 bits technology before it uploads data using a certified SSL connection.
